and also most of the pages on codeplex link to that particular toolkit. A: I created a sample application using Winforms in vs.net 2005 with database in sqlserver 2005. it worked fine. I cannot see any issues with your steps. However, I would suggest you to post the questions on codeplex forums as they have great communities. [Effects of temperature, light and pH on the growth of the sulphate-reducing bacteria in human dental plaque]. The effect of temperature, light and pH on the growth of sulphate-reducing bacteria (SRB) in human dental plaque was studied. The bacterial count and the sulphate reduction activity in the mixed plaque with cells in the stationary phase of growth was increased by raising the temperature or by continuous illumination, whereas it was decreased by raising the pH of the medium. The SRB in human dental plaque can be retained for a considerable time. Their growth was slightly affected by a decrease of pH in the medium. Lipolytic activity of *Trichoderma harzianum* isolates from the rhizosphere of endemic Chilean Barley. The presence of endophytic and epiphytic fungi and bacteria in the rhizosphere of plant is common and can result in the production of metabolites with antimicrobial, insecticidal, and plant growth-promoting activities. The objective of this study was to investigate the effect of the culture supernatant of endophytic and epiphytic strains isolated from the rhizosphere of the endemic Chilean barley, *Hordeum brevisubulatum*, on the growth of six isolates of *Trichoderma harzianum* in order to evaluate the potential of these strains to be used in biological control of barley diseases. The effect of the culture filtrate was tested on the growth of the isolates by the cup test and on the lipidic degradation by glycerol phosphate, and production of the metabolite hydrogen peroxide. The strains of *T. harzianum* tested showed variations in the production of metabolites and in their effects on barley and grasses. The strains from the rhizosphere of barley were more effective on the control of grasses and maize and less effective against barley, particularly when the effect of the culture filtrate was evaluated. The results show that the culture filtrate of the isolates had varied effects on the growth of the tested strains. Some isolates had more than one effect, as shown by the production of hydrogen
